

LPG CYLINDER SAFETY

NP GAS has taken all the necessary precautions to supply your 20lb and 100lb cylinders, but safety doesn't stop with us, you still have a part to play.

PLEASE FOLLOW THESE **3 RULES** WHEN HANDLING 20LB CYLINDERS:

RULE #1

Ensure that the regulator/pressure valve is appropriately locked onto the valve of the cylinder. After doing so, verify by manually lifting the locked regulator/pressure valve with the cylinder off the ground.

RULE #2

Always use the approved regulator/pressure valve that meets the EN 12864 and EN 16129 standards for household use. Do not use regulator/pressure valves with the adjustable gas flow valves for domestic use.

RULE #3

Ensure that the hose is in good working condition. Replace a hose that is brittle or has cracks and kinks. It is recommended that the hoses be replaced every five (5) years and must be the correct type. Hoses should be inspected on every change of a new cylinder.

SAFETY
TIP
